4/4 answered

Q1 Handling ArithmeticException

10 marks

Write a Java program to divide two integers entered by the user. If the denominator is zero, handle the exception using a try-catch block and display an appropriate error message.

Your Code

```
1 import java.util.Scanner;
2 public class Main {
3     public static void main(String[] args) {
4         Scanner scanner=new Scanner(System.in);
5         try {int num1=scanner.nextInt();int num2=scanner.nextInt();int
6             System.out.println("Result: " + result);} catch (Arithmetic
7             System.out.println("Exception caught: Division by zero is n
8         }
9     }
10 }
```

Input

10 0

Output

Exception caught: Division by zero
is not allowed.

Q2 Handling ArrayIndexOutOfBoundsException

10 marks

Write a Java program to create an integer array of five elements. Ask the user to enter an index and display the corresponding element. If the index is outside the valid range, handle the exception and display an error message.

Your Code

```
1 import java.util.Scanner;
2 public class Main {
3     public static void main(String[] args) {
4         Scanner scanner = new Scanner(System.in);
5         int[] arr = {10, 20, 30, 40, 50};
6         try {
7             int index = scanner.nextInt();
8             System.out.println("Element at index " + index + ": " + arr[index]);
9         } catch (ArrayIndexOutOfBoundsException e) {
10             System.out.println("Exception caught: Array index out of bounds");
11         }
12     }
13 }
```

Input

stdin input

Output

Q3 Handling NumberFormatException

10 marks

Write a Java program to accept a number as a string and convert it into an integer using Integer.parseInt(). If the input is not a valid integer, handle the exception and display an appropriate message.

Your Code

```
1 import java.util.Scanner;
2 public class Main{
3     public static void main(String[] args){
4         Scanner scanner=new Scanner(System.in);
5         String input=scanner.nextLine();
6         try {int number=Integer.parseInt(input);System.out.println("Co
7     } catch (NumberFormatException e){
8         System.out.println("Exception caught: Invalid integer form
9     }
10 }
11 }
```

Input

fdsf

Output

Exception caught: Invalid integer
format.

Q4 Handling Multiple Exceptions

10 marks

Write a Java program that performs the following operations:
Accept two integers from the user.
Divide the first number by the second.
Store the result in an array.
Handle both ArithmeticException and ArrayIndexOutOfBoundsException using multiple catch blocks.

Your Code

```
1 import java.util.Scanner;
2 public class Main {
3     public static void main(String[] args) {
4         Scanner scanner= new Scanner(System.in);
5         int[] arr =new int[1];
6         try { int num1=scanner.nextInt();
7             int num2=scanner.nextInt();
8             int index=scanner.nextInt();
9             int result=num1 /num2;
10            arr[index]= result;
11            System.out.println("Result: " + arr[index]);}
12     catch (ArithmeticException e) {System.out.println("Exception c
13 } catch (ArrayIndexOutOfBoundsException e){
14     System.out.println("Exception caught: Array index out of b
15 }
16 }
17 }
```

Input

10 2 0

Output

Result: 5
